Application tracks

Application tracks enable attendees to group and explore presentations in the conference programs to more easily plan their event schedule around the topic of interest. Application track filters span across all conferences at an SPIE event. The ability to group presentations has the reciprocal benefit of helping authors' presentations be more easily found.

See conference app or website for a full listing of presentations in each of these tracks:

Photon Counting CT

SC1129 • Level: Introductory
Sunday, 18 February 2024 • 1:30 PM–5:30 PM

Member: \$495.00 | Non-member: \$560.00
Student member: \$324.00

INSTRUCTORS

Mats Danielsson, KTH Royal Institute of Technology (Sweden)

Mats U. Persson, KTH Royal Institute of Technology (Sweden)

This course explains the principles of photon counting detectors for spectral x-ray imaging. Typical technical implementations are described and fundamental differences to energy integrating systems are pointed out. In particular, the issues of high-rate handling and the effect of detector cross talk on energy resolution are described. Requirements on electronics for spectral imaging in computed tomography is also discussed. A second objective of the course is to describe how energy sensitive counting detectors make use of the energy sampling of the linear attenuation coefficients of the background and target materials for any given imaging task; methods like material basis decomposition and optimal energy weighting will be explained. The second objective highlights the interesting fact that while the spatial-frequency descriptor of signal-to-noise-ratio transfer (DQE) of a system gives a complete characterization of performance for energy integrating (and pure photon counting) systems, it fails to characterize multibin systems since a complete description of the transfer characteristics requires specification of how the information of each energy bin is han-

dled. The latter is in turn dependent on the imaging case at hand which shows that there is no such thing as an imaging case independent system DQE for photon counting multibin systems. We also suggest how this issue could be resolved.

ATTENDEE TESTIMONIAL:

The instructor has a lot of knowledge and is shown when the course members are asking questions.

It was a very complete presentation. I was able to leave having a general knowledge on photon counting CT and its applications. Now I have some new research ideas to explore.

Very worth to participate that course again! Looking forward to next year!

Modern Diagnostic X-ray Sources

SC1183 • Level: Introductory
Sunday, 18 February 2024 • 8:30 AM–12:30 PM

Member: \$495.00 | Non-member: \$560.00
Student member: \$324.00

INSTRUCTOR

Rolf K. Behling, KTH Royal Institute of Technology (Germany)

During recent decades, in particular since the advent of computed tomography and the increasing sophistication of interventional X-ray systems, progress in the development of diagnostic X-ray sources has been tremendous. More than 100,000 diagnostic X-ray tubes are being installed or replaced every year. Tubes for dental application, non-destructive testing and

material analytics add to this. As a sound basis for their work, specialists and academicians working in the realm of X-rays like system developers, medical and X-ray physicists and clinicians may want to improve their background knowledge. Literature on the topic has grown recently, among others with several publications by the lecturer, including a standard textbook. In addition, this course will offer 1:1 interaction to improve understanding the physics of production of “clinical” X-rays for diagnostics. It will comprehensively treat functional principles of X-ray sources. Design aspects, special features, radiation protection, modern performance metric, manufacturing technology, and cost aspects will be discussed. Why is vacuum technology not at all regarded outdated? Will we find the X-ray LED, compact X-ray Lasers or flat panel sources in medical imaging soon? Why do hundreds of tube types populate the market? The lecture will cover system performance aspects related to the source, material boundary conditions, and manufacturing technology. The quest for affordable healthcare demands for trade-offs between value and cost, and objective comparison of tube types. Initial costs and costs of tube replacement will be discussed as well as means to extend tube life and to save natural resources. Recent technology and application will be treated. Last but not least, the lecture may spark fascination for these vacuum electronic light sources off the scientific mainstream.

ATTENDEE TESTIMONIAL:

Very informative, very comprehensive.

From Analytic to Clinical Validation: Moving AI/ML into Practice

SC1295 • Level: Intermediate

Monday, 19 February 2024 • 8:30 AM–5:30 PM

Member: \$795.00 | Non-member: \$905.00

Student member: \$462.00

INSTRUCTORS

William Y. Hsu, Univ. of California, Los Angeles (USA)

Matthew S. Brown, UCLA Ctr. for Computer Vision and Imaging Biomarkers (USA)

Robert M. Nishikawa, Univ. of Pittsburgh (USA)

Elizabeth A. Krupinski, Emory Univ. School of Medicine (USA)

Artificial Intelligence (AI) is increasingly being used in a wide variety of medical imaging applications. Most of the focus, however, is on algorithm and scheme development, but this is only part of the picture. In order to have an impact on clinical decision making, workflow and patient care these AI tools must be evaluated using real-world cases and actual clinical providers that are expected to use them in routine care. The techniques used to conduct these types of studies are less well known in this field thus investigators need to be trained the proper study design and analysis methods. This course will cover basic principles, techniques, and process for validating models developed using artificial intelligence (AI)/machine learning (ML) techniques. The primary goal of this course is to help the audience understand and apply fundamental principles related to designing, executing, and interpreting model evaluation studies. The course will be organized around two parts: analytic validation and clinical validation. In the first half, the audience will be exposed to approaches for performing a technical validation of a prediction model, including different study designs, appropriate statistical tests, metrics, dataset considerations, and decision curve analysis. The second half will cover the process of undertaking clinical validation that would address real-world use of models, regulatory and deployment issues. Topics include

workflow integration, prospective clinical trials, reader impact studies, and regulatory approvals. Examples will focus on imaging-related models that are drawn from literature and the instructors’ personal experiences in prognostic modeling, computer-aided diagnosis, and imaging biomarker development.

ATTENDEE TESTIMONIAL:

Course was very valuable for me. Great interactions with all instructors. Very relevant.

It was the best course ever

Transformers: A Powerful Tool for Image Analysis and Generation

SC1324 • Level: Intermediate

Sunday, 18 February 2024 • 8:30 AM–5:30 PM PST

Member: \$865.00 | Non-member: \$975.00

Student member: \$490.00

This is an interactive course and participants will need to bring their own laptops.

INSTRUCTORS

Markus T. Wenzel, Fraunhofer-Institut für Digitale Medizin MEVIS (Germany)

Hans Meine, Fraunhofer-Institut für Digitale Medizin MEVIS (Germany)

Felix Thielke, Fraunhofer-Institut für Digitale Medizin MEVIS (Germany)

Compared to the tremendous success models like GPT4, Bard, or Llama, which are all based on transformers, had in the field of text analysis, machine translation, and de-novo text generation, it took longer for transformers to enter the scene of image analysis and image generation. Reasons being the high demands in terms of compute and data. More successful approaches in training transformers have led to a change that will likely be as impactful as the introduction of CNNs for image classification. Already, first (still limited) “image foundation models” have been published, and also in medical image analysis, several attempts are being made to parallel the semantic understanding and emergence seen in large language models for image models. In this course, we explain the thought model and elementary mathematics of the attention mechanism underlying transformers. You will learn in theory and explore in hands-on work the reason for their modeling capacity and understand why this creates the need of larger training datasets. The course traces the development of transformers for image analysis tasks and shows ways to pre-train transformers on weak or unlabeled data. The course concludes with examples of applications used in medical image analysis tasks.

ATTENDEE TESTIMONIAL:

I really enjoyed the course!

Loved it! Thank you for such a great overview!

Interpretable Deep Learning in Medical Imaging

Cynthia Rudin
Duke Univ. (USA)

We would like deep learning systems to aid radiologists with difficult decisions instead of replacing them with inscrutable black boxes. “Explaining” the black boxes with XAI tools is problematic, particularly in medical imaging where the explanations from XAI tools are inconsistent and unreliable. Instead of explaining the black boxes, we can replace them with interpretable deep learning models that explain their reasoning processes in ways that people can understand. One popular interpretable deep learning approach uses case-based reasoning, where an algorithm compares a new test case to similar cases from the past (“this looks like that”), and a decision is made based on the comparisons. Radiologists often use this kind of reasoning process themselves when evaluating a new challenging test case. In this talk, I will demonstrate interpretable machine learning techniques through applications to mammography and EEG analysis.

Trustworthy AI: Validation, Reproducibility, Biases

20 February 2024 • 1:40 PM–3:20 PM | Town & Country B

How to ensure that medical imaging AI is trustworthy? How to know if one can trust the results presented in research papers? These are fundamental questions that the field of medical imaging needs to address to lead to true advances in clinical care. At this workshop, three world-class experts will address the following key issues in trustworthy AI: 1) the selection of appropriate metrics for validating AI algorithms in medical imaging; 2) the reproducibility of results which is a cornerstone of the scientific method; 3) the risk that AI algorithms are contaminated by bias, making their outputs potentially misleading and their application unfair. The talks will be followed by a discussion of learnings and Q&A involving the three speakers.

The goal of this workshop is to provide a forum for systems and algorithms developers to show off their creations. The intent is for the audience to be inspired to conduct derivative research, for the demonstrators to receive feedback and find new collaborators, and for all to learn about the rapidly evolving field of medical imaging. The Live Demonstrations Workshop invites participation from all attendees of the SPIE Medical Imaging symposium. Workshop demonstrations include samples, systems, and software demonstrations that depict the implementation, operation, and utility of cutting-edge as well as mature research. Having an accepted SPIE Medical Imaging paper is not required for giving a live demonstration. A certificate of merit and \$500 award will be presented to one demonstration considered to be of exceptional interest.

The Live Demonstrations Workshop invites participation from all attendees of the SPIE Medical Imaging symposium. Workshop demonstrations include samples, systems, and software demonstrations that depict the implementation, operation, and utility of cutting-edge as well as mature research. Having an accepted SPIE Medical Imaging paper is not required for giving a live demonstration. A certificate of merit and \$500 award will be presented to one demonstration considered to be of exceptional interest.

Establishing ground truth is one of the hardest parts in an imaging experiment. In this workshop we'll talk to pathologists, radiologists, an imaging scientist (who evaluates imaging technology without ground truth), and an FDA staff scientist (who creates his own ground truth) to determine how to best deal with this difficult problem.

Moderator:

Ronald Summers, National Institutes of Health (United States)

Panelists:

Richard Levenson, Univ. of California, Davis (United States)

Steven Horii, Univ. of Pennsylvania (United States)

Abhinav Kumar Jha, Washington Univ., St. Louis (United States)

The goal of this workshop is to provide a forum for systems and algorithms developers to show off their creations. The intent is for the audience to be inspired to conduct derivative research, for the demonstrators to receive feedback and find new collaborators, and for all to learn about the rapidly evolving field of medical imaging. The Live Demonstrations Workshop invites participation from all attendees of the SPIE Medical Imaging symposium. Workshop demonstrations include samples, systems, and software demonstrations that depict the implementation, operation, and utility of cutting-edge as well as mature research. Having an accepted SPIE Medical Imaging paper is not required for giving a live demonstration. A certificate of merit and \$500 award will be presented to one demonstration considered to be of exceptional interest.

The SPIE Conferences app supports attendee-to-attendee messaging to facilitate professional networking among meeting participants. This feature should not be used to push high-volume solicitations, and messaging will be disabled for attendees who exceed reasonable use or are in violation of other SPIE event policies. Attendees should report inappropriate use via the app reporting feature. SPIE will also monitor for high-volume patterns suggesting improper use.

SPIE Conferences app connect feature

The connect feature in the SPIE Conferences app is a personal networking tool that allows individuals to share their contact information with other attendees via their phones while using the SPIE app. This tool should not be used for systematic scanning of badges for managing sales leads. Inappropriate use is a violation of event policy.

SPIE Conferences app lead retrieval feature

The lead retrieval feature in the SPIE Conferences app is a lead generation tool that allows attendees to share their contact information with SPIE exhibitors. Exhibitor representatives using the lead retrieval app may scan attendee badges in the exhibition or supporting company events after receiving permission from an attendee. It should not be used in the technical conference area. The lead retrieval feature will be disabled for exhibitor representatives who exceed reasonable use or are in violation of other SPIE event policies. Attendees should report inappropriate use by notifying staff or contacting support via the help link in the app.

Attendee registration and admission policies

SPIE, or their officially designated event management, in their sole discretion, reserves the right to accept or decline an individual's registration for an event. Further, SPIE, or event management, reserves the right to prohibit entry of or to remove any individual whether registered or not, be they attendees, exhibitors, representatives, or vendors, whose conduct is not in keeping with the character and purpose of the event. Without limiting the foregoing, SPIE and event management reserve the right to remove or refuse entry to anyone who has registered or gained access under false pretenses, provided false information, or for any other reason whatsoever that they deem is cause under the circumstances.

Capture and use of a person's image

By registering for an SPIE event, you grant full permission to SPIE to capture, store, use, and/or reproduce your image or likeness, including incidental capture of any individuals in your household or workplace, by any audio and/or visual recording technique and create derivative works of these images and recordings in any SPIE media now known or later developed, for any legitimate SPIE purpose. By registering for an SPIE event, you waive any right to inspect or approve the use of the images or recordings or of any written copy. You also waive any right to royalties or other compensation arising from or related to the use of the images, recordings, or materials. By registering, you release, defend, indemnify, and hold harmless SPIE from and against any claims, damages, or liability arising from or related to the use of the images, recordings, or materials, including but not limited to claims of defamation, invasion of privacy, or rights of publicity or copyright infringement, or any misuse, distortion, blurring, alteration, optical illusion, or use in composite form that may occur or be produced in taking, processing, reduction, or production of the finished product, its publication or distribution.

Code of conduct

SPIE is committed to providing a harassment- and discrimination-free experience for everyone at our events, an experience that embraces the richness of diversity where participants may exchange ideas, learn, network, and socialize in the company of colleagues in an environment of mutual respect.

Event and course cancellation by SPIE

If for some unforeseen reason, SPIE should have to cancel a course or an entire event, processed registration fees for the canceled activity will be refunded to registrants. Registrants will be responsible for the cancellation of travel arrangements or housing reservations and the applicable fees.

Family-friendly policy

Conference events: all conference technical and networking events require a badge for admission. Registered attendees may bring children with them if they have been issued a badge. Registration badges for children under 18 are free and available at the SPIE registration desk onsite. Children under 14 years of age must be accompanied by an adult at all times, and guardians are asked to help maintain a professional, disturbance-free conference environment.

Identification requirement

To verify registered participants and provide a measure of security, SPIE will ask attendees to present a government-issued photo identification at registration to collect registration materials. Individuals are not allowed to pick up badges for other attendees. Further, attendees may not have some other person participate in their place at any conference-related activity. Such other individuals will be required to register on their own behalf to participate.

For online events, SPIE requires individuals to register with their legal identity.

Laser-pointer safety policy

SPIE events are subject to the applicable laser safety rules and regulations of the host location. SPIE supplies industry-standard Class 2 presentation laser pointers for all conference and other meeting rooms. For safety reasons, SPIE requests that presenters use provided laser pointers. The use of a personal laser pointer represents the user's acceptance of liability for any damage or injuries to the presenter or others.

No smoking policy

Attendees will observe all non-smoking regulations that are publicly posted by the facilities used by the event.

Online commenting policy

SPIE moderates all comments posted in an online event. We encourage robust discussion, the exchange of scientific ideas, and the sharing of multiple, diverse perspectives. We expect the discussion to be consistent with the norms of scholarly research community interactions at events. Online event participants should report any comments or content that falls short of those community norms. We will remove comments, content, or people that are considered inappropriate by SPIE standards or that:

- are defamatory, libelous, obscene, indecent, abusive, or threatening to others
- infringe the copyright, trademark, or other rights of a third party
- upload viruses or are a cybersecurity hazard
- are off-topic or inappropriately commercial in nature
- are in violation of any applicable laws or regulations

Payment policy

Registrations must be fully paid before access to the conference is allowed. SPIE accepts VISA, MasterCard, American Express, Discover, Diner's Club, checks, and wire transfers. Onsite registrations can also be paid with cash.

Recording policy

Conferences and poster sessions: audio and video recordings are prohibited without prior written consent of SPIE and the presenter. Consent forms are available at Speaker Check-in, SPIE Registration, or the Chair Services Desk. Individuals not complying with this policy will be asked to surrender their recording media and leave the conference room. Refusal to comply with such requests is grounds for expulsion from the event. Please see the SPIE code of conduct.

Courses: audio and video recordings are prohibited without explicit permission from SPIE and the instructor. Individuals not complying with this policy will be asked to surrender their recording media and leave the classroom. Refusal to comply with such requests is grounds for expulsion from the event.

Unauthorized solicitation

Unauthorized solicitation in the exhibition hall is prohibited. Any non-exhibiting organization observed to be distributing information or soliciting business in the aisles, or in another company's booth, will be asked to leave immediately.

Unsecured items

Personal belongings should not be left unattended in meeting rooms or public areas. Unattended items are subject to removal by security. SPIE is not responsible for items left unattended.

Wireless internet service

At most events, SPIE provides wireless access for attendees. Properly secure your computer before accessing the public wireless network. SPIE is not responsible for computer viruses or other kinds of computer damage.
